

SYSTEM AND METHOD FOR THE AGGREGATION AND MATCHING OF PERSONAL INFORMATION

Abstract

Embodiments of the invention enable users with communication devices to access profiles and perform matches on profiles aggregated from multiple independent computer systems regardless of communications device type or operating system and regardless of affiliate match server computer type, operating system or language. In addition, embodiments of the invention allow users to join groups based on static or dynamic physical location parameters and dial other users and send multi-media data without prior knowledge of a phone number.
